### Project Description:

This project utilized all aspects of IPI/IPE's "design-build" capabilities. The customer provided process design information from which IPE generated system documents including 3D models, general arrangement drawings, piping isometrics, structural details, and electrical designs. IPI then provided the fabrication and project management expertise which resulted in the supply of six fully integrated modules. Along with pipe and steel, IPI procured, received, and inspected customer specified equipment, instrumentation, and valves. After individual assembly, the modules were brought together to do final piping tie-ins, electrical incorporation, insulation and painting. Factory acceptance testing including electrical and mechanical check-outs were done on site prior to disassembly for final shipment to South America.
